Project Planning & Management

This project aims to analyze a supply chain dataset to extract insights, improve decision-making, and build an interactive dashboard.

The project was divided into six main phases:

1) Data Collection

Gather raw data from different sources

2) Data Cleaning

Remove errors and prepare data for analysis

3) Data Modeling

Organize data and build relationships

4) DAX

Create measures and calculated insights

5) Report

Summarize key findings and insights

6) Dashboard

Build interactive visuals for decision-making

Literature Review

Previous studies highlight the importance of data analytics in improving supply chain performance. Researchers have shown that analyzing sales, inventory, and logistics data helps organizations reduce costs and enhance efficiency.

Many studies also emphasize the role of data visualization tools such as Power BI and Tableau in simplifying complex data and supporting decision-making.

In addition, forecasting techniques are widely used to predict demand trends, allowing companies to better manage inventory and avoid stock shortages or overstocking.

Requirements Gathering

The system was designed to support decision-makers such as managers and analysts.

Key requirements include:

- **Tracking sales and profitability**
- **Monitoring inventory performance**
- **Evaluating supplier efficiency**
- **Analyzing shipping and delivery performance**

The dataset includes sales, orders, inventory, and supplier-related data to support these needs.

System Analysis & Design

A data model was built to connect different tables such as sales, products, and suppliers.

Key KPIs were defined, including:

- **Total Sales**
- **Profit**
- **Inventory Status**
- **Delivery Performance**

An interactive dashboard was designed using Tableau to visualize insights through charts and KPIs, enabling users to explore the data

The End

Thank You
